

COMP 110/401

COLLECTION KINDS

Instructor: Prasan Dewan

PREREQUISITE

- Arrays Collections Implementation

COLLECTION TYPES

- StringHistory, StringDatabase, StringSet
- Array
- ArrayList, List
- Map
- Stack
- Queue

STRUCTURED VS. ATOMIC TYPES

Atomic Types

Primitive types

double

int

Classes

ABMICalculator

Interfaces

BMICalculator

Structured Types

Classes

ACartesianPoint

StringHistory

Interfaces

Point

AStringHistory

Instances of structure type decomposed into one or more smaller values

LOGICAL STRUCTURE POINT

LOGICAL STRUCTURE ARRAY

BEAN VS. ARRAY

Components can be of different types and serve different functions

Components are of same type (which may be a super type of the specific types of the components) and are handles in the same way

```
Object[] objects = { "Joe Doe", new AStringDatabase(), new AStringHistory()};
```

BEAN VS. (INDEXED) COLLECTION

INDEXED COLLECTIONS

Each element identified by a unique index

Successive elements have consecutive indices

STRINGHISTORY?

size()

elementAt()

addElement()

String
History

```
<terminated> AHistoryDriver [Java Application]
```

```
James Dean
```

```
p
```

```
*****
```

```
James Dean
```

```
*****
```

```
Joe Doe
```

```
Jane Smith
```

```
p
```

```
*****
```

```
James Dean
```

```
Joe Doe
```

```
Jane Smith
```

```
*****
```

```
q
```

STRINGHISTORY

`stringHistory.elementAt(position + 1)`

Collection: Program fragment can refer to any component of the composite object

Indexed collection: components referred explicitly by int expressions

STRINGHISTORY VS. ARRAY

```
<terminated> AHistoryDriver [Java Application]
James Dean
p
*****
James Dean
*****
Joe Doe
Jane Smith
p
*****
James Dean
Joe Doe
Jane Smith
*****
q
```

```
String[] strings= { "James Dean", "Joe Doe", "Jane Smith"};
```

Static and Language-defined

STATIC VS. DYNAMIC STRUCTURES

Static

Beans have fixed number of properties

Arrays have fixed number of elements

Though an array variable can be assigned arrays of different sizes

Dynamic

Can create new edges in logical structure

HISTORY

```
public interface StringHistory {  
    public void addElement(String element);  
    public int size();  
    public String elementAt(int index);  
}
```

DATABASE

```
public interface StringDatabase {  
    //from history  
    public int size();  
    public void addElement(String element);  
    public String elementAt(int index);  
  
    //additional methods  
    public void removeElement(String element);  
    public boolean member(String element);  
    public void clear();  
}
```

Do we need a history if we have a database?

Yes, principle of least privilege

PRINCIPLE OF LEAST PRIVILEGE/ NEED TO KNOW

- Do not give a user of some code more rights than it needs
 - Code is easier to change
 - Need to learn less to use code
 - Less likelihood of accidental or malicious damage to program
- Like hiding engine details from car driver

VISIBILITY OF A TYPE AND ITS MEMBERS: SOME TYPE ARE MORE EQUAL THAN OTHERS

Co-packaged a la co-workers, amplifier + speakers

Subtype a la family, deluxe amplifier

Encapsulation Rule: Do not make variables of a class public

USING DATABASE AS HISTORY

```
public interface StringDatabase {  
    //from history  
    public int size();  
    public void addElement(String element);  
    public String elementAt(int index);  
  
    //additional methods  
    public void removeElement(String element);  
    public boolean member(String element);  
    public void clear();  
}
```

Programmer would be able to perform inappropriate operations on a logical history implemented physically as a database

CO-EXISTENCE

```
public interface StringDatabase extends StringHistory {  
    //additional methods  
    public void removeElement(String element);  
    public boolean member(String element);  
    public void clear();  
}
```

Programmer would be able to perform inappropriate operations on a logical history implemented physically as a database

VECTOR: GENERAL OBJECT COLLECTION

```
public final int size();  
public final Object elementAt(int index);  
public final void addElement(Object obj) ;  
public final void setElementAt(Object obj, int index);  
public final void insertElementAt(Object obj, int index);  
public final boolean removeElement(Object obj);  
public final void removeElementAt(int index);  
public final int indexOf(Object obj);  
...
```

Do we need other collections if we have Vector

Yes, principle of least privilege

Yes, implementation considerations

CLASS ARRAYLIST AND VECTOR (LIST)

```
public final int size();  
public final Object get(int index);  
public final void add(Object obj) ;  
public final void set(int index, Object obj);  
public final void insert(int index, Object obj);  
public final boolean remove(Object obj);  
public final void remove(int index);  
public final int indexOf(Object obj);  
...
```

Vector has ArrayList (List) methods plus the additional original methods in the previous slides

Can add arbitrary objects to these collections

ARRAY LIST AND VECTOR USER

```
import java.util.ArrayList;
import java.util.List;
import java.util.Vector;
public class VectorArrayListUser {
    public static void main (String[] args) {
        List names = new Vector();
        List grandSlams = new ArrayList();
        names.add("Nadal");
        grandSlams.add(13);
        names.add("Federer");
        grandSlams.add(17);
        names.add("Borg");
        grandSlams.add(11);
        names.add("Sampras");
        grandSlams.add(14);
    }
}
```

What kind of dynamic structure is being simulated?

INDEXED COLLECTIONS

Each element identified by a unique index

Successive elements have consecutive indices

TABLES

Each element identified by a unique object called a key

Usually strings are used as keys

HASHMAP (IMPLEMENTS MAP)

```
// associates key with value, returning last value associated with key  
public final Object put (Object key, Object value);  
// returns last value associated with key, or null if no association  
public final Object get (Object key);
```

Final means method cannot be overridden

HASHMAP USE

```
public static void main (String[] args) {  
    Map aMap = new HashMap();  
    aMap.put("Nadal", 10);  
    aMap.put("Federer", 17);  
    aMap.put("Sampras", 14);  
    System.out.println(aMap.get("Nadal"));  
    System.out.println(aMap.get("nadal"));  
    aMap.put("Nadal", 11);  
    System.out.println(aMap.get("Nadal"));  
    System.out.println(aMap);  
}
```

MapUser [Java Application] C:\Program Files\Java\jre6\bin\javaw.exe (Oct 2, 2012 10:58:49 AM)

10

null

11

{Sampras=14, Federer=17, Nadal=11}

EXPLICIT VS. IMPLICIT ELEMENT REFERENCE

Collection: Program fragment can refer to any component of the composite object

Indexed collection: components referred explicitly by int expressions

Table collection: components referred explicitly by Object expressions

Implicit reference to components?

STACK: LAST IN FIRST OUT

```
public interface StringStack {  
    public boolean isEmpty();  
    public String getTop();  
    public void push(String element);  
    public void pop();  
}
```

```
StringStack stringStack = new AStringStack();  
stringStack.push("James Dean");  
stringStack.push("Joe Doe");  
stringStack.push("Jane Smith");  
stringStack.push("John Smith");  
System.out.println(stringStack.getTop());  
stringStack.pop();  
System.out.println(stringStack.getTop());
```

```
John Smith  
Jane Smith
```

QUEUE: FIRST IN FIRST OUT

```
public interface StringQueue {  
    public boolean isEmpty();  
    public String getHead();  
    public void enqueue(String element);  
    public void dequeue();  
}
```

```
StringQueue stringQ = new AStringQueue();  
stringQ.enqueue("James Dean");  
stringQ.enqueue("Joe Doe");  
stringQ.enqueue("Jane Smith");  
stringQ.enqueue("John Smith");  
System.out.println(stringStack.getHead());  
stringQ.dequeue();  
System.out.println(stringStack.getHead());
```

```
James Dean  
Joe Doe
```

STRUCTURED TYPES

Static named

Static indexed

Dynamic indexed

(Static) Dynamic tables

Stack (LIFO)

Queue (FIFO)

READ-ONLY AND EDITABLE PROPERTIES

Typed, Named Unit of Exported Class State

VISUALIZING COLLECTIONS

```
public interface StringHistory {  
    public void addElement(String element);  
    public int size();  
    public String elementAt(int index);  
}
```

```
public static void main (String[] args) {  
    StringHistory stringHistory = new AStringHistory();  
    stringHistory.addElement("James Dean");  
    stringHistory.addElement("Joe Doe");  
    stringHistory.addElement("Jane Smith");  
    stringHistory.addElement("John Smith");  
    ObjectEditor.edit(stringHistory);  
}
```

CONVENTIONS FOR VARIABLE-SIZED COLLECTION

Convention
based on Vector

Write method (optional)

```
@StructurePattern(StructurePatternNames.VECTOR_PATTERN)
public interface C{
    public T elementAt (int index);
    public int size();
    public Any setElementAt(T t, int index);
    ...
}
```

Arbitrary Type.

Read methods

Unconstrained Type (void or T in practice)

ALTERNATIVE CONVENTIONS FOR VARIABLE-SIZED COLLECTION

READ VS. WRITE METHODS

- Read Methods
 - Used to get components of object
 - Getter methods
 - `size()`, `elementAt()`
- Write Methods
 - Used to change components of object
 - Setter methods
 - `addElement()`, `removeElement()`, `setElementAt()`
 - some used by Object Editor
- Distinction independent of conventions and important for Model-View-Controller and other paradigms you will see later
- Conventions used in Object Editor

CONVENTIONS FOR VARIABLE-SIZED COLLECTION

APOINTHISTORY

Variable-sized Collection

History

Methods added to menu
associated with class

Graphic elements of dynamic
collections added at their (X, Y)
locations

HASHMAP USE

```
public static void main (String[] args) {  
    Map aMap = new HashMap();  
    aMap.put("Nadal", 10);  
    aMap.put("Federer", 17);  
    aMap.put("Sampras", 14);  
    System.out.println(aMap.get("Nadal"));  
    System.out.println(aMap.get("nadal"));  
    aMap.put("Nadal", 11);  
    System.out.println(aMap.get("Nadal"));  
    System.out.println(aMap);  
    ObjectEditor.edit(aMap);  
}
```

MapUser [Java Application] C:\Program Files\Java\jre6\bin\javaw.exe (Oct 2, 2012 10:58:49 AM)

```
10  
null  
11  
{Sampras=14, Federer=17, Nadal=11}  
oeall20 Copyright Prasun Dewan, 2011, All rights reserved  
Object Editor Version: 20  
Built On: Unknown time because of java version incompatibility
```

OE CONVENTIONS FOR TABLE

```
// associates key with value, returning last value associated with key
public <ValueType> put (<KeyType> key, <ValueType> value);
// returns last value associated with key, or null if no association
public <ValueType> get (<KeyType> key);
// optional, removes associated value, and returns it or null
public <ValueType> remove(<KeyType> key);
```

Necessary but not sufficient to displays all keys and elements

DISPLAYING STACK (LIFO)

```
public interface StringStack {  
    public boolean isEmpty();  
    public String getTop();  
    public void push(String element);  
    public void pop();  
}
```

Does not provide read methods for reading all elements

```
StringStack stringStack = new AStringStack();  
stringStack.push("James Dean");  
stringStack.push("Joe Doe");  
stringStack.push("Jane Smith");  
stringStack.push("John Smith");  
ObjectEditor.edit(stringStack);
```

DISPLAYING TRANSPARENT STACK (LIFO)

```
public interface TransparentStringStack {  
    public int size();  
    public String get(int index);  
    public void push(String element);  
    public void pop();  
}
```

Provides read methods following OE collection conventions

```
StringStack stringStack = new AS  
stringStack.push("James Dean");  
stringStack.push("Joe Doe");  
stringStack.push("Jane Smith");  
stringStack.push("John Smith");
```

Can provide additional method for top value
