

IPC and Processes

Lecture 24

Class 26 of 28 | April 20th 2023 | COMP 211-002 | Joshua Bakita

Welcome!

Today:

- Logistics
- Inter-Process Communication
- Assignment 5 Functions

Logistics:

- For regrade reqs., prefer Gradescope or Pizza
- Research opportunity if you get an A/A-

Fun fact...

You can run any shell command from inside vim via the ! command in normal mode.

Example:

```
:!gcc modify.c -o modify  
to compile modify
```

Front Matter

Logistics

Final Exam:

- Tues, May 2nd, Noon to 3 PM
- Comprehensive, emphasis on first half of the course
- Format like midterms, drawing from class, readings, and assignments
- 20% Weight
 - ◆ Min 40% for non-F overall grade
- Can replace lower of two midterms
- ARS Extended Time in SN314

Assignments:

- A3.** Final grades very soon
- A4.** Late due date now passed.
 - Target: Grades next Thursday
- A5.** Due by the final exam
- A6.** Cut
 - Previously extra-credit only
 - Lots of extra credit opportunities in A5
 - Come talk with me about GPUs!

8% each

10%+

If you have a final conflict, or 3 in 24h exception, form: <https://eef.oasis.unc.edu/>

Why care about edge cases?

Why care about edge cases?

When edge cases are not handled...

Some space missions that failed due to a software bug:

- Phobos 1 – Test code left enabled
- Ariane-5 – Integer overflow
- Mars Climate Orbiter – Navigation failure due to treating imperial units as metric
- Mars Global Surveyor – Memory corruption

The results can be disastrous! Get in the habit of doing it right.

Don't forget to check your code for memory errors with valgrind!

Inter-Process Communication (IPC)

Beyond Signals

Inter-Process Communication

What and why?

- Signals are often not enough
- What if we want to communicate data, but want to avoid the (slow) process of creating a file on disk?

Just a unidirectional sequence of bytes

Pipes

Shared Memory

Message Passing

Typed messages, can be sent bi-directionally (not shown)

Inter-Process Communication

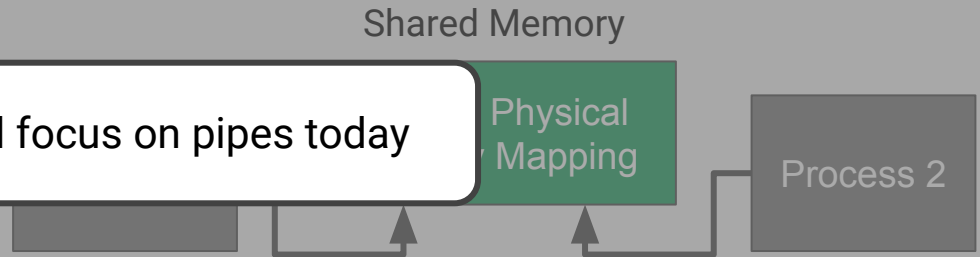

What and why?

- Signals are often not enough
- What if we want to communicate data, but want to avoid the (slow) process of creating a file on disk?

Just a unidirectional sequence of bytes

We'll focus on pipes today

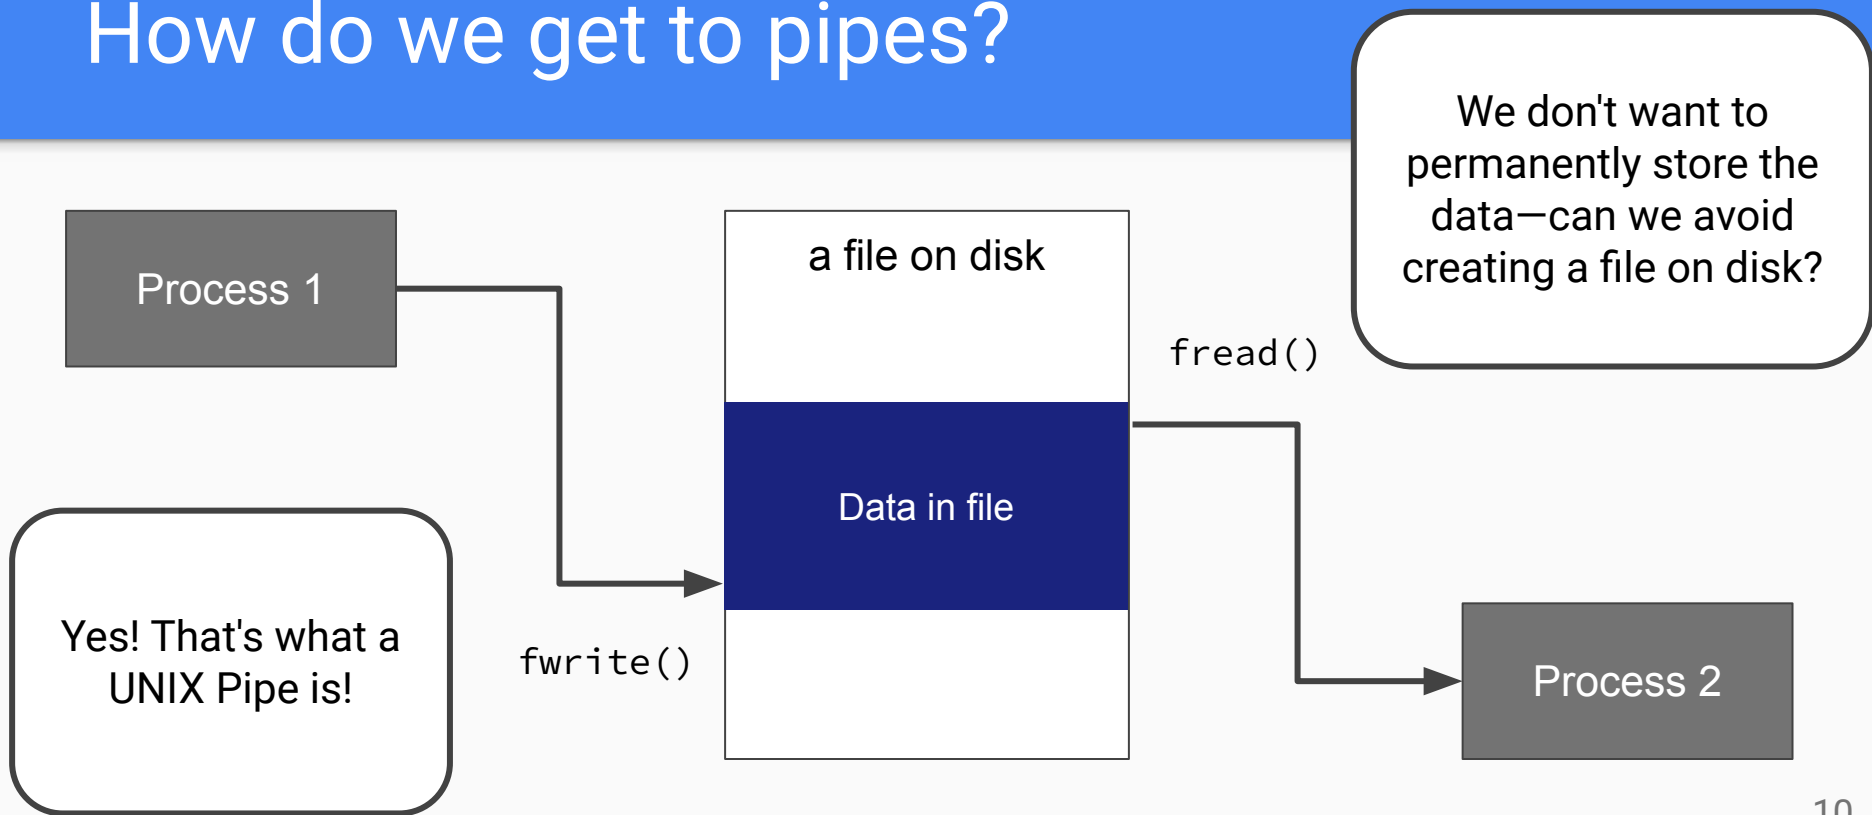

Message Passing

Typed messages, can be sent bi-directionally (not shown)

Inter-Process Communication

How do we get to pipes?

Inter-Process Communication

You've already been using pipes

`stdin`, `stdout`, and `stderr` are (by default) all just open pipes, connected to or from your terminal!

Inter-Process Communication

UNIX Pipes API

- Create pipes via the `pipe()` function
- This gives to file descriptors (FDs):
 - ◆ One that can be written to
 - ◆ One that can be read from
- Simply `read()` or `write()` using the respective FD
 - ◆ Or use `fdopen()` to convert it to a `FILE*` (`man fdopen`)
- See `man 2 pipe` and the readings on the course webpage

Inter-Process Communication

Demo

Let's also look at a few things for A5, like `fork()`,
`execvp()`, `wait()` and maybe `dup2()`
