COMP 530: Operating Systems

Review: Address Spaces

- Physical address space — The address space supported by the hardware
 - Starting at address 0, going to address MAX_{sys}
- Logical/virtual address space — A process's view of its own memory
 - Starting at address 0, going to address MAX_{prog}

But where do addresses come from?

```
MOV r0, @0xffffa620e
```

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

- Which is bigger, physical or virtual address space?
 - A. Physical address space
 - B. Virtual address space
 - C. It depends on the system.

COMP 530: Operating Systems

Address Space Generation

- The compilation pipeline

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Program Relocation

- Program issues virtual addresses
- Machine has physical addresses.
- If virtual == physical, then how can we have multiple programs resident concurrently?
- Instead, relocate virtual addresses to physical at run time.
 - While we are relocating, also bounds check addresses for safety.
- I can relocate that program (safely) in two registers...

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

2 register translation

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

- With base and bounds registers, the OS needs a hole in physical memory at least as big as the process.
 - A. True
 - B. False

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

The Fragmentation Problem

- External fragmentation
 - Unused memory between units of allocation
 - E.g., two fixed tables for 2, but a party of 4
- Internal fragmentation
 - Unused memory within a unit of allocation
 - E.g., a party of 3 at a table for 4

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Dynamic Allocation of Partitions

- Simple approach:
 - Allocate a partition when a process is admitted into the system
 - Allocate a contiguous memory partition to the process

OS keeps track of...
Full-blocks
Empty-blocks ("holes")

Allocation strategies
First-fit
Best-fit
Worst-fit

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

First Fit Allocation

To allocate n bytes, use the *first* available free block such that the block size is larger than n .

To allocate 400 bytes, we use the 1st free block available

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

First Fit: Rationale and Implementation

- Simplicity!
- Requires:
 - Free block list sorted by address
 - Allocation requires a search for a suitable partition
 - De-allocation requires a check to see if the freed partition could be merged with adjacent free partitions (if any)

Advantages	Disadvantages
<ul style="list-style-type: none"> Simple Tends to produce larger free blocks toward the end of the address space 	<ul style="list-style-type: none"> Slow allocation External fragmentation

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Best Fit Allocation

To allocate n bytes, use the *smallest* available free block such that the block size is larger than n .

To allocate 400 bytes, we use the 3rd free block available (smallest)

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Best Fit: Rationale and Implementation

- Avoid fragmenting big free blocks
- To minimize the size of external fragments produced
- Requires:
 - Free block list sorted by size
 - Allocation requires search for a suitable partition
 - De-allocation requires search + merge with adjacent free partitions, if any

Advantages	Disadvantages
<ul style="list-style-type: none"> Works well when most allocations are of small size Relatively simple 	<ul style="list-style-type: none"> External fragmentation Slow de-allocation Tends to produce many useless tiny fragments (not really great)

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Worst Fit Allocation

To allocate n bytes, use the *largest* available free block such that the block size is larger than n .

To allocate 400 bytes, we use the 2nd free block available (largest)

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Worst Fit: Rationale and Implementation

- Avoid having too many tiny fragments
- Requires:
 - Free block list sorted by size
 - Allocation is fast (get the largest partition)
 - De-allocation requires merge with adjacent free partitions, if any, and then adjusting the free block list

Advantages	Disadvantages
<ul style="list-style-type: none"> Works best if allocations are of medium sizes 	<ul style="list-style-type: none"> Slow de-allocation External fragmentation Tends to break large free blocks such that large partitions cannot be allocated

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Allocation strategies

- First fit, best fit and worst fit all suffer from external fragmentation.
 - A. True
 - B. False

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Eliminating Fragmentation

- Compaction
 - Relocate programs to coalesce holes
- Swapping
 - Preempt processes & reclaim their memory

THE UNIVERSITY of NORTH CAROLINA at CHAPEL HILL

COMP 530: Operating Systems

Sharing Between Processes

- Schemes so far have considered only a single address space per process
 - A single *name space* per process
 - No sharing

How can one share code and data between programs without paging?
