

## Condition Synchronization

### Synchronization

- ◆ Now that you have seen locks, is that all there is?
- ◆ No, but what is the “right” way to build a parallel program.
  - People are still trying to figure that out.
- ◆ Compromises:
  - between making it easy to modify shared variables AND
  - restricting when you can modify shared variables.
  - between really flexible primitives AND
  - simple primitives that are easy to reason about.

### Beyond Locks

- ◆ Synchronizing on a condition.
  - When you start working on a synchronization problem, first define the mutual exclusion constraints, then ask “when does a thread wait”, and create a separate synchronization variable representing each constraint.
- ◆ Bounded Buffer problem – producer puts things in a fixed sized buffer, consumer takes them out.
  - What are the constraints for bounded buffer?
    - 1) only one thread can manipulate buffer queue at a time (*mutual exclusion*)
    - 2) consumer must wait for producer to fill buffers if none full (*scheduling constraint*)
    - 3) producer must wait for consumer to empty buffers if all full (*scheduling constraint*)

### Beyond Locks

- ◆ Locks ensure mutual exclusion
- ◆ Bounded Buffer problem – producer puts things in a fixed sized buffer, consumer takes them out.
  - Synchronizing on a condition.

```

Class BoundedBuffer{
...
void* buffer[];
Lock lock;
int count = 0;
}
                    
```

What is wrong with this?

```

BoundedBuffer::Deposit(c){
lock->acquire();
while (count == n); //spin
Add c to the buffer;
count++;
lock->release();
}
                    
```

```

BoundedBuffer::Remove(c){
lock->acquire();
while (count == 0); // spin
Remove c from buffer;
count--;
lock->release();
}
                    
```

### Beyond Locks

```

Class BoundedBuffer{
...
void* buffer[];
Lock lock;
int count = 0;
}
                    
```

What is wrong with this?

```

BoundedBuffer::Deposit(c){
while (count == n); //spin
lock->acquire();
Add c to the buffer;
count++;
lock->release();
}
                    
```

```

BoundedBuffer::Remove(c){
while (count == 0); // spin
lock->acquire();
Remove c from buffer;
count--;
lock->release();
}
                    
```

### Beyond Locks

```

Class BoundedBuffer{
...
void* buffer[];
Lock lock;
int count = 0;
}
                    
```

What is wrong with this?

```

BoundedBuffer::Deposit(c){
if (count == n) sleep();
lock->acquire();
Add c to the buffer;
count++;
lock->release();
if(count == 1) wakeup(remove);
}
                    
```

```

BoundedBuffer::Remove(c){
if (count == 0) sleep();
lock->acquire();
Remove c from buffer;
count--;
lock->release();
if(count==n-1) wakeup(deposit);
}
                    
```

### Beyond Locks

```

Class BoundedBuffer{
...
void* buffer[];
Lock lock;
int count = 0;
}

```

What is wrong with this?

```

BoundedBuffer::Deposit(c){
lock->acquire();
if (count == n) sleep();
Add c to the buffer;
count++;
if(count == 1) wakeup(remove);
lock->release();
}

```

```

BoundedBuffer::Remove(c){
lock->acquire();
if (count == 0) sleep();
Remove c from buffer;
count--;
if(count==n-1) wakeup(deposit);
lock->release();
}

```

### Beyond Locks

```

Class BoundedBuffer{
...
void* buffer[];
Lock lock;
int count = 0;
}

```

What is wrong with this?

```

BoundedBuffer::Deposit(c){
while(1) {
lock->acquire();
if(count == n) {
lock->release();
continue;}
Add c to the buffer;
count++;
lock->release();
break;
}
}

```

```

BoundedBuffer::Remove(c){
while(1) {
lock->acquire();
if (count == 0) {
lock->release();
continue;
}
Remove c from buffer;
count--;
lock->release();
break;
}
}

```

### Introducing Condition Variables

- Correctness requirements for bounded buffer producer-consumer problem
  - Only one thread manipulates the buffer at any time (mutual exclusion)
  - Consumer must wait for producer when the buffer is empty (scheduling/synchronization constraint)
  - Producer must wait for the consumer when the buffer is full (scheduling/synchronization constraint)
- Solution: condition variables
  - An abstraction that supports conditional synchronization
  - Condition variables are associated with a monitor lock
  - Enable threads to wait inside a critical section by releasing the monitor lock.

### Condition Variables: Operations

- Three operations
  - Wait()
    - Release lock
    - Go to sleep
    - Reacquire lock upon return
    - Java Condition interface `await()` and `awaitUninterruptably()`
  - Notify() (historically called `Signal()`)
    - Wake up a waiter, if any
    - Condition interface `signal()`
  - NotifyAll() (historically called `Broadcast()`)
    - Wake up all the waiters
    - Condition interface `signalAll()`
- Implementation
  - Requires a per-condition variable queue to be maintained
  - Threads waiting for the condition wait for a notify()

Wait() usually specified a lock to be released as a parameter

### Implementing Wait() and Notify()

```

Condition::Notify(lock){
schedLock->acquire();
if (lock->numWaiting > 0) {
Move a TCB from waiting queue to ready queue;
lock->numWaiting--;
}
schedLock->release();
}

```

```

Condition::Wait(lock){
schedLock->acquire();
lock->numWaiting++;
lock->release();
Put TCB on the waiting queue for the CV;
schedLock->release();
switch();
lock->acquire();
}

```

Why do we need schedLock?

### Using Condition Variables: An Example

- Coke machine as a shared buffer
- Two types of users
  - Producer: Restocks the coke machine
  - Consumer: Removes coke from the machine
- Requirements
  - Only a single person can access the machine at any time
  - If the machine is out of coke, wait until coke is restocked
  - If machine is full, wait for consumers to drink coke prior to restocking
- How will we implement this?
  - What is the class definition?
  - How many lock and condition variables do we need?

Coke Machine Example	
	<pre> Class CokeMachine{ ... Storage for cokes (buffer) Lock lock; int count = 0; Condition notFull, notEmpty; } </pre>
<pre> CokeMachine::Deposit(){ lock-&gt;acquire(); while (count == n) { notFull.wait(&amp;lock); } Add coke to the machine; count++; notEmpty.notify(); lock-&gt;release(); } </pre>	<pre> CokeMachine::Remove(){ lock-&gt;acquire(); while (count == 0) { notEmpty.wait(&amp;lock); } Remove coke from to the machine; count--; notFull.notify(); lock-&gt;release(); } </pre>
13	

Coke Machine Example	
<b>Liveness issue</b>	<pre> Class CokeMachine{ ... Storage for cokes (buffer) Lock lock; int count = 0; Condition notFull, notEmpty; } </pre>
<pre> CokeMachine::Deposit(){ lock-&gt;acquire(); while (count == n) { notFull.wait(&amp;lock); } Add coke to the machine; count++; notEmpty.notify(); lock-&gt;release(); } </pre>	<pre> CokeMachine::Remove(){ lock-&gt;acquire(); while (count == 0) { notEmpty.wait(&amp;lock); } Remove coke from to the machine; count--; lock-&gt;release(); notEmpty.notify(); } </pre>
14	

Java syntax for condition variables	
	<ul style="list-style-type: none"> <li>◆ Condition variables created from locks <pre> import java.util.concurrent.locks.ReentrantLock; public static final aLock = new ReentrantLock(); public static ok = aLock.newCondition(); public static int count; aLock.lock(); try { while(count &lt; 16){ok.awaitUninterruptably()} } finally { aLock.unlock(); } } return 0; </pre> </li> </ul>
15	

Summary	
	<ul style="list-style-type: none"> <li>◆ Non-deterministic order of thread execution → concurrency problems <ul style="list-style-type: none"> <li>➢ Multiprocessing <ul style="list-style-type: none"> <li>◆ A system may contain multiple processors → cooperating threads/ processes can execute simultaneously</li> </ul> </li> <li>➢ Multi-programming <ul style="list-style-type: none"> <li>◆ Thread/process execution can be interleaved because of time-slicing</li> </ul> </li> </ul> </li> <li>◆ Goal: Ensure that your concurrent program works under ALL possible interleaving</li> <li>◆ Define synchronization constructs and programming style for developing concurrent programs <ul style="list-style-type: none"> <li>◆ Locks → provide mutual exclusion</li> <li>◆ Condition variables → provide conditional synchronization</li> </ul> </li> </ul>
